MiseOS GridOps Playground

The Personal Metaverse for Autonomous Repository Systems.

NotebookLM

Everything in its place. Every agent with proof.

Before a kitchen can move fast, every ingredient has a place. Before autonomous systems can work safely, every repository, task, agent, and tool needs a structural home.

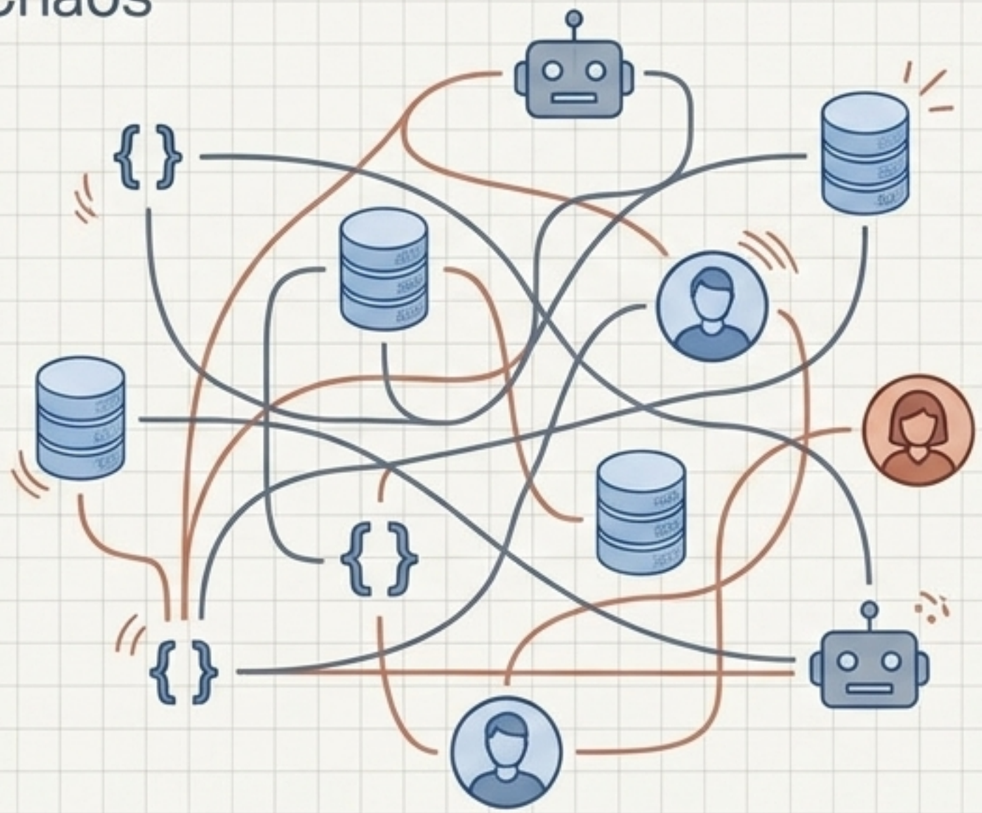

NotebookLM

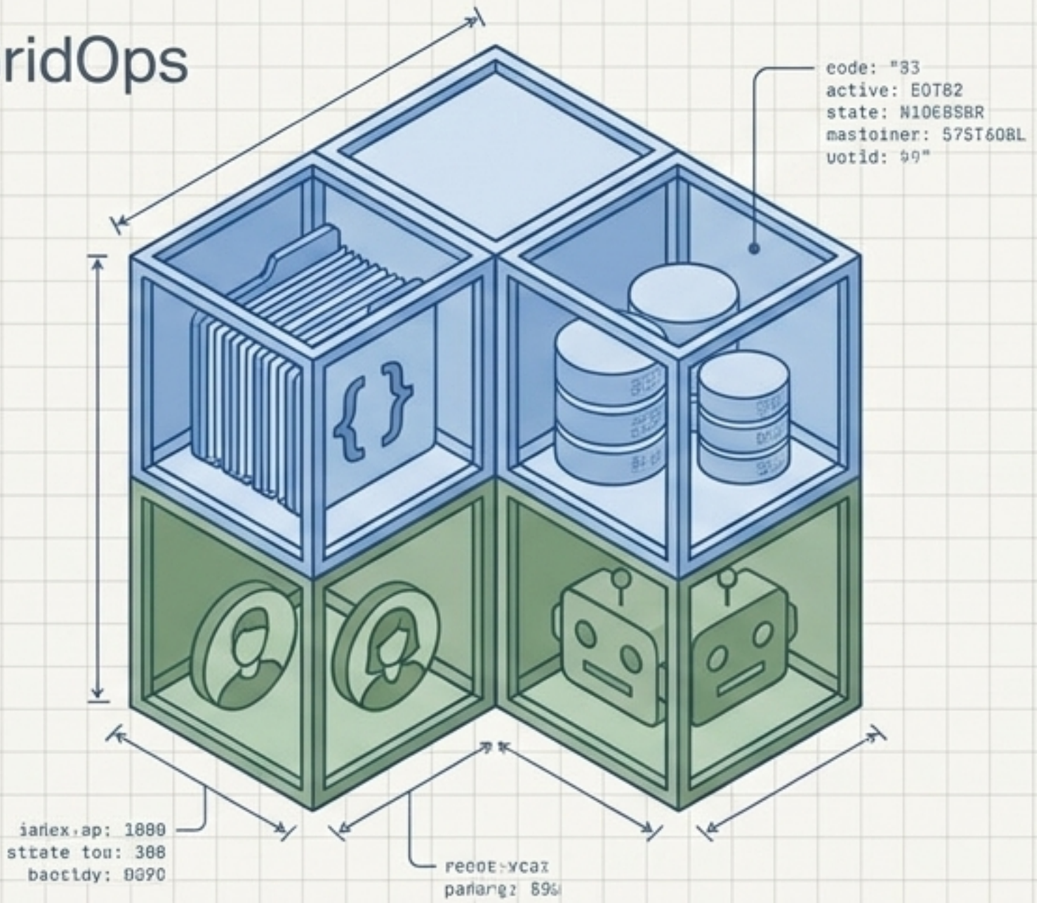

Turn flat repositories into a living operational map.

The modern development stack is scattered. Autonomous agents currently operate in invisible loops. MiseOS transforms this chaos into a structured grid where agents can be watched, constrained, and deployed safely.

Chaos

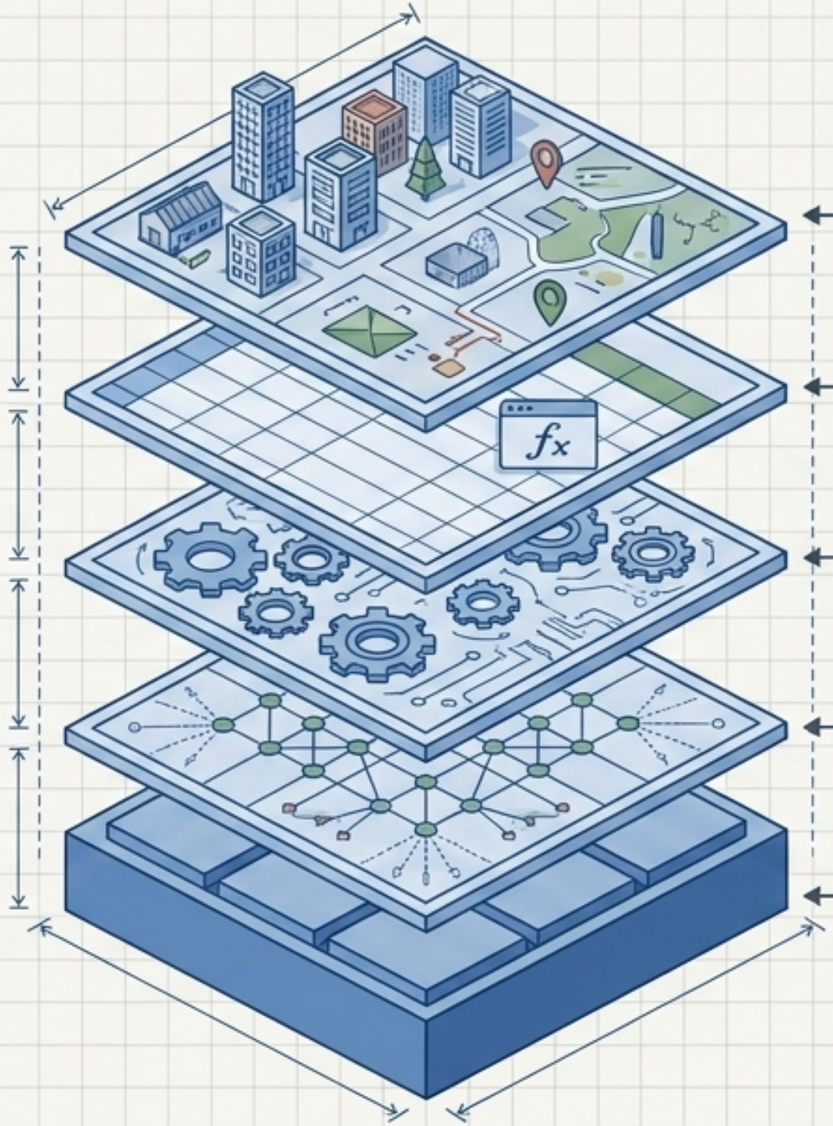

GridOps

NotebookLM

The Five-Layer Architecture Stack

Metaverse Playground UI:
Spatial visual execution map

Spreadsheet Grid:
Tabs, rows & HyperFormula engine

Agent Control Plane:
Autonomous workers & routing

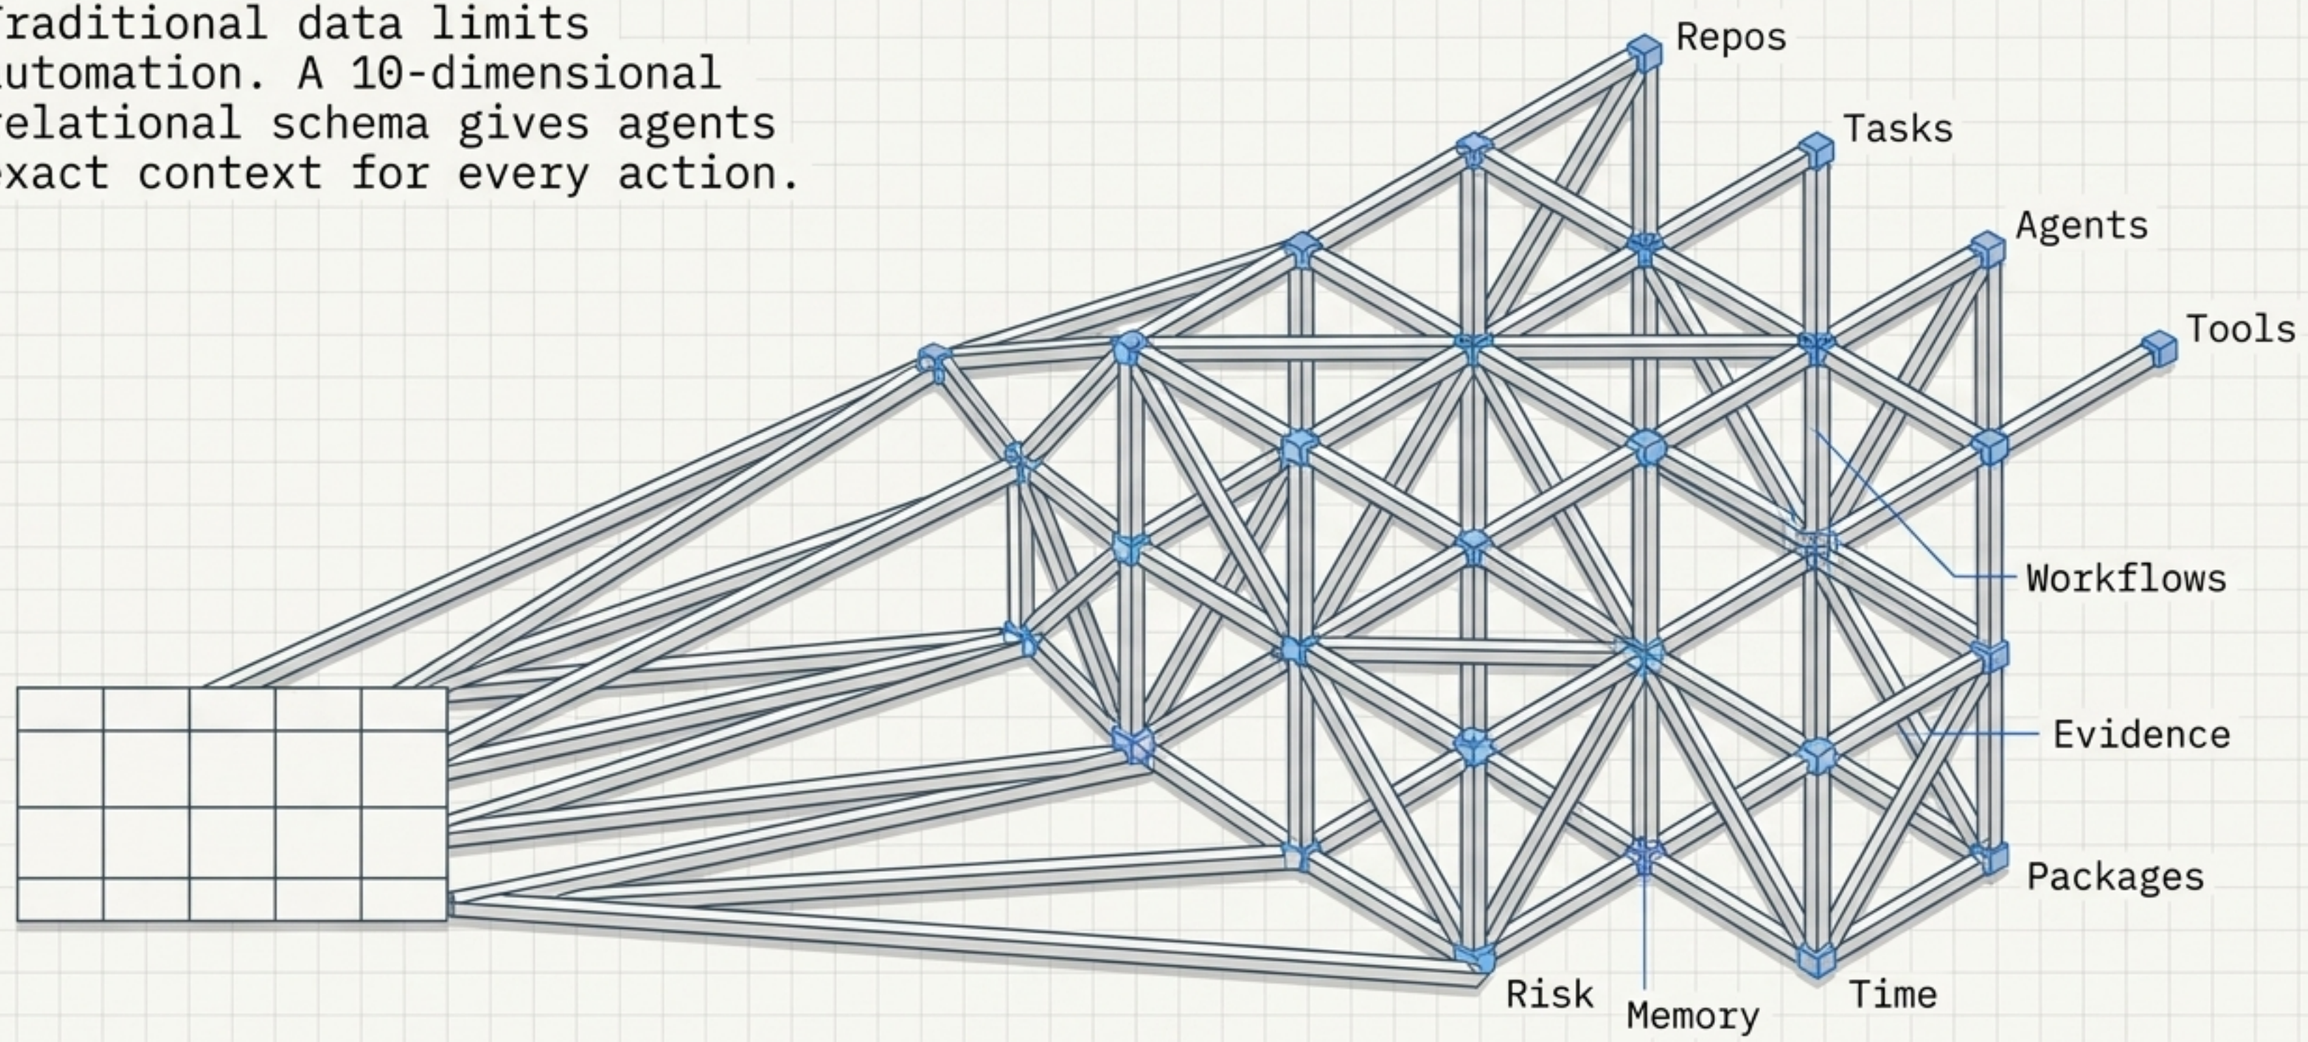

RAG Memory Layer:
Searchable pgvector embeddings

Database Brain:
Structured PostgreSQL records

NotebookLM

Escaping Flat Data: The 10-Dimensional Model

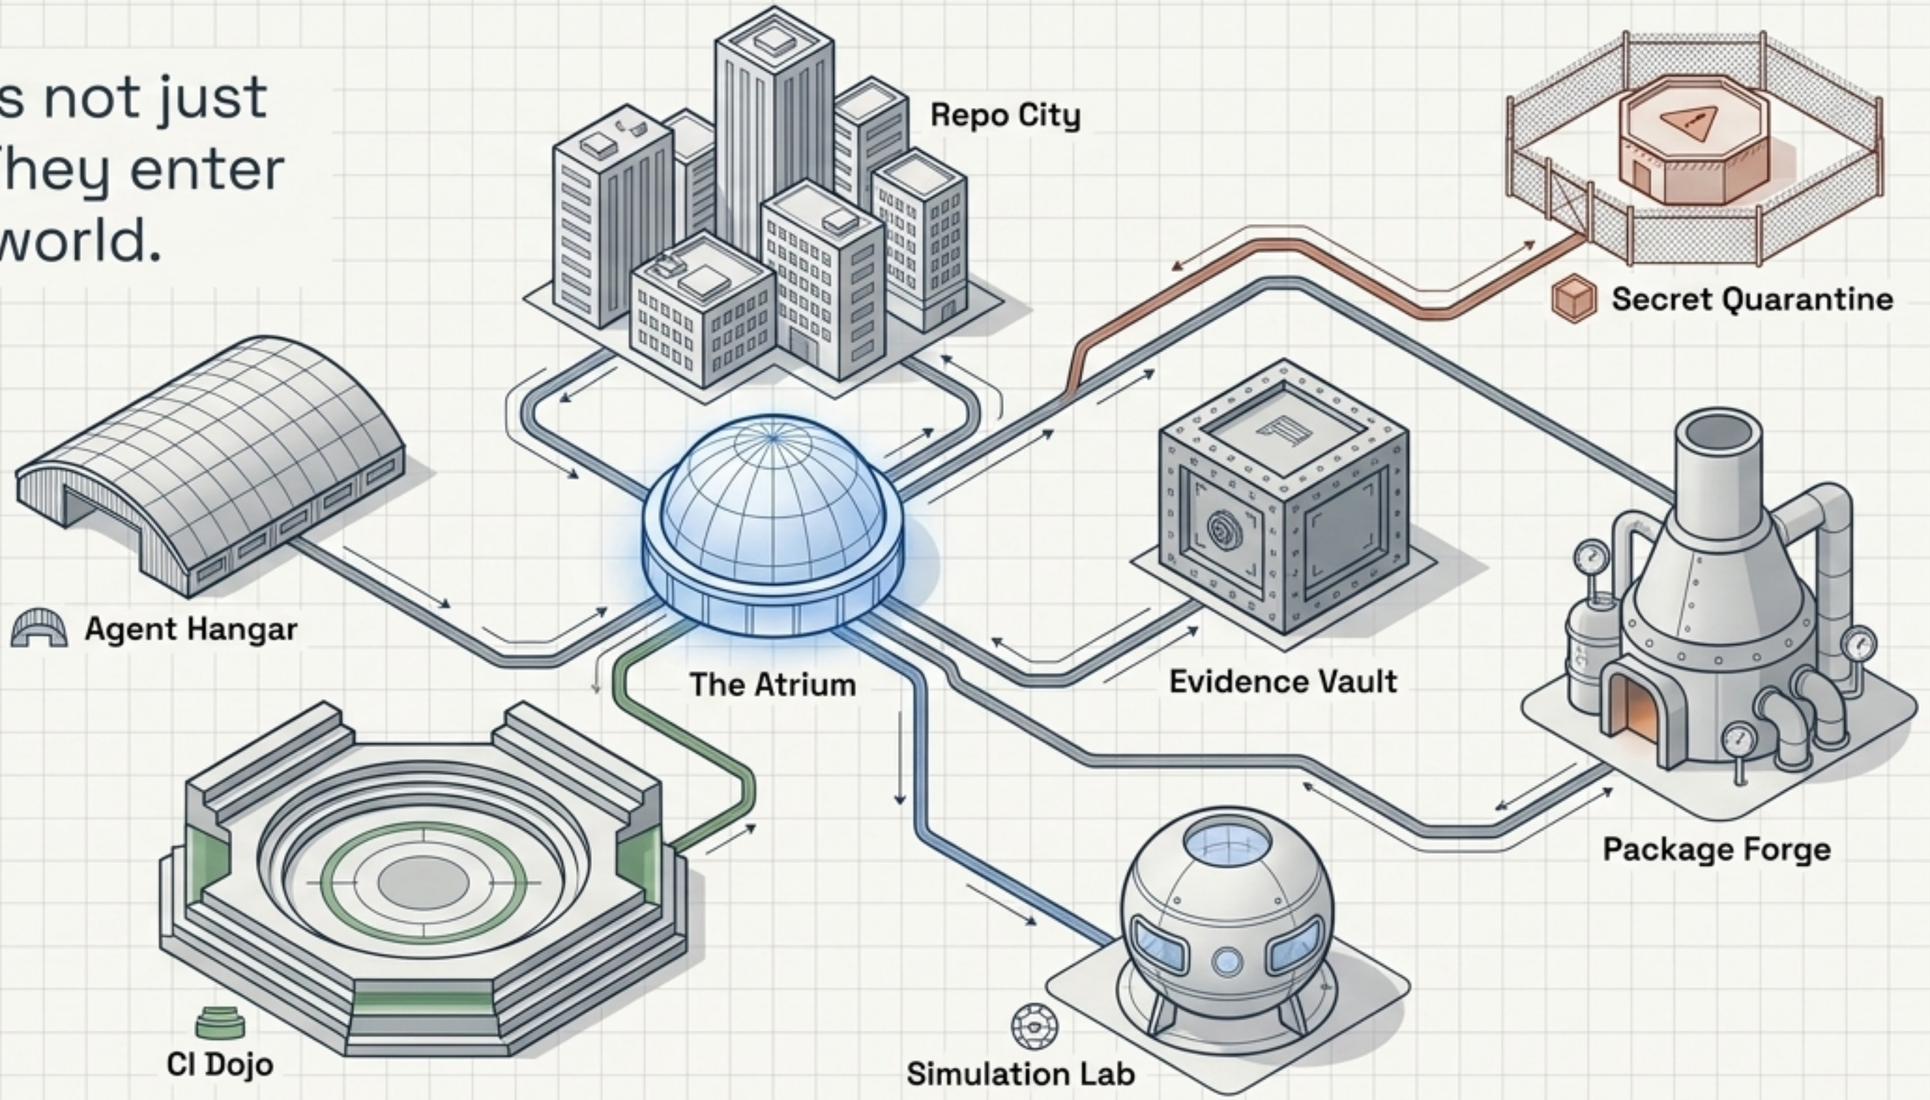

Traditional data limits automation. A 10-dimensional relational schema gives agents exact context for every action.

NotebookLM

The Metaverse Map

The user does not just see a table. They enter a repository world.

NotebookLM

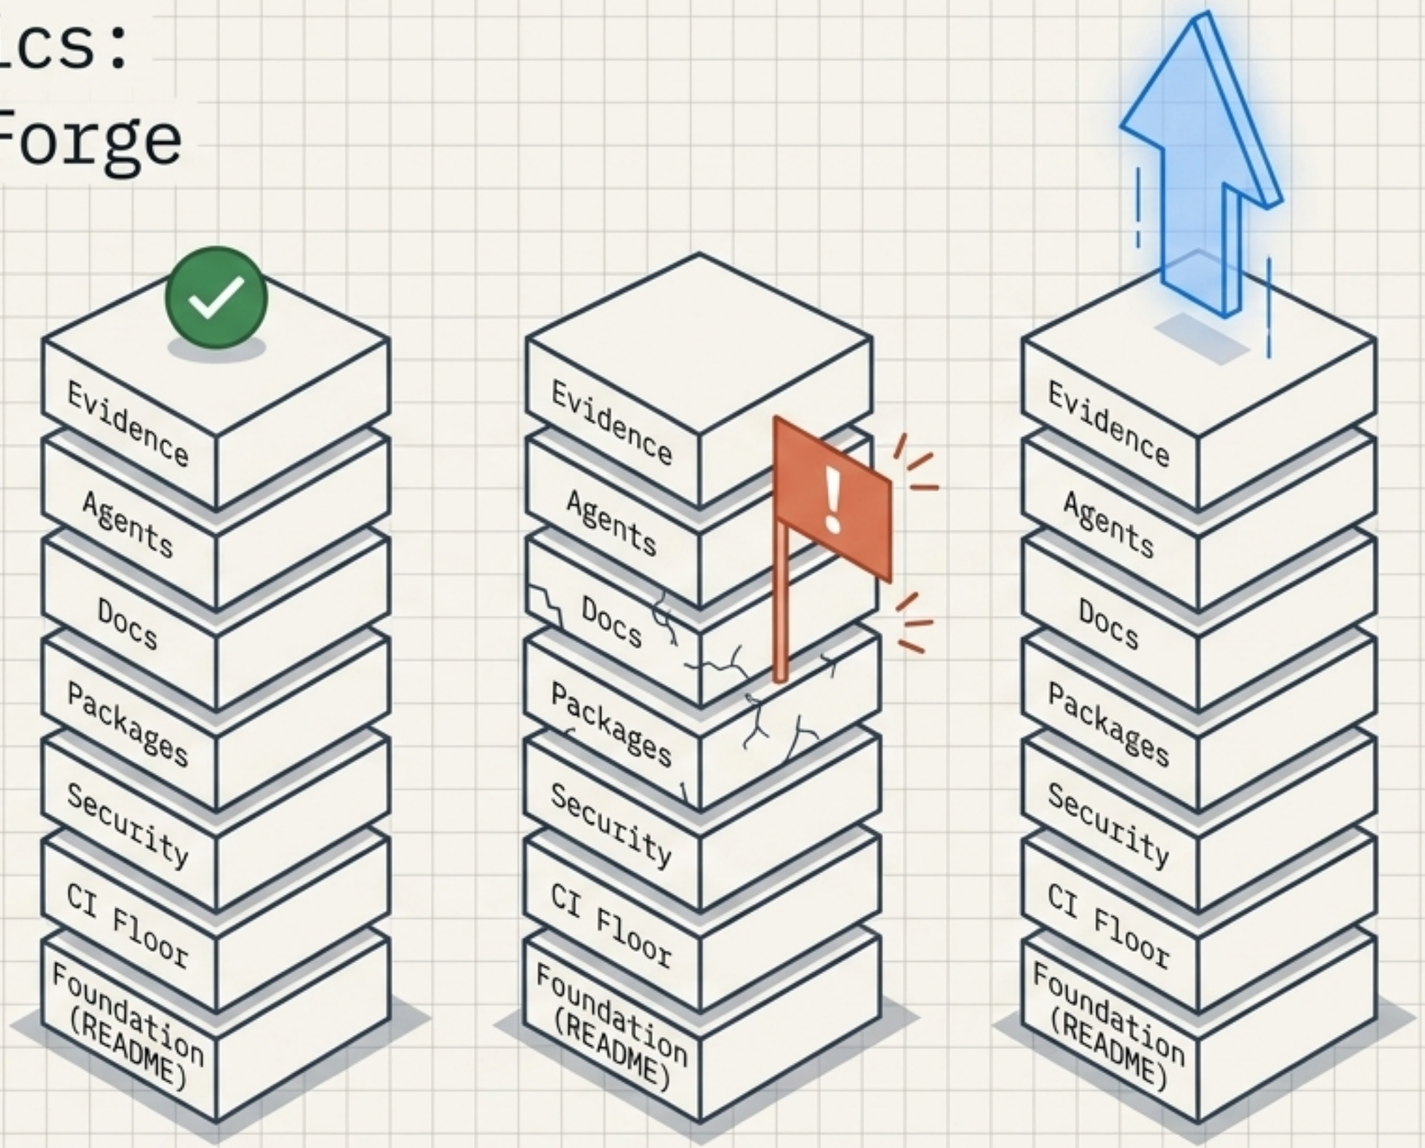

Surface Control: The Mise Grid & Atrium

NotebookLM

Structural Diagnostics: Repo City & Package Forge

Navigate scale by translating code into space. Visually identify package drift or release-ready code by looking at the structural skyline.

NotebookLM

Active Repair: The CI Dojo

Explain | Repair | Simulate | Compare | Teach

```
Building project...

Checking dependencies...
Compiling src/main.js...
Error: module not found
Build failed. Check logs for details.

Waiting for input...
```

Added missing import based on previous build history.

```
+ import { module } from 'library';
```

NotebookLM

The Safety Engine: Evidence Vault & Quarantine

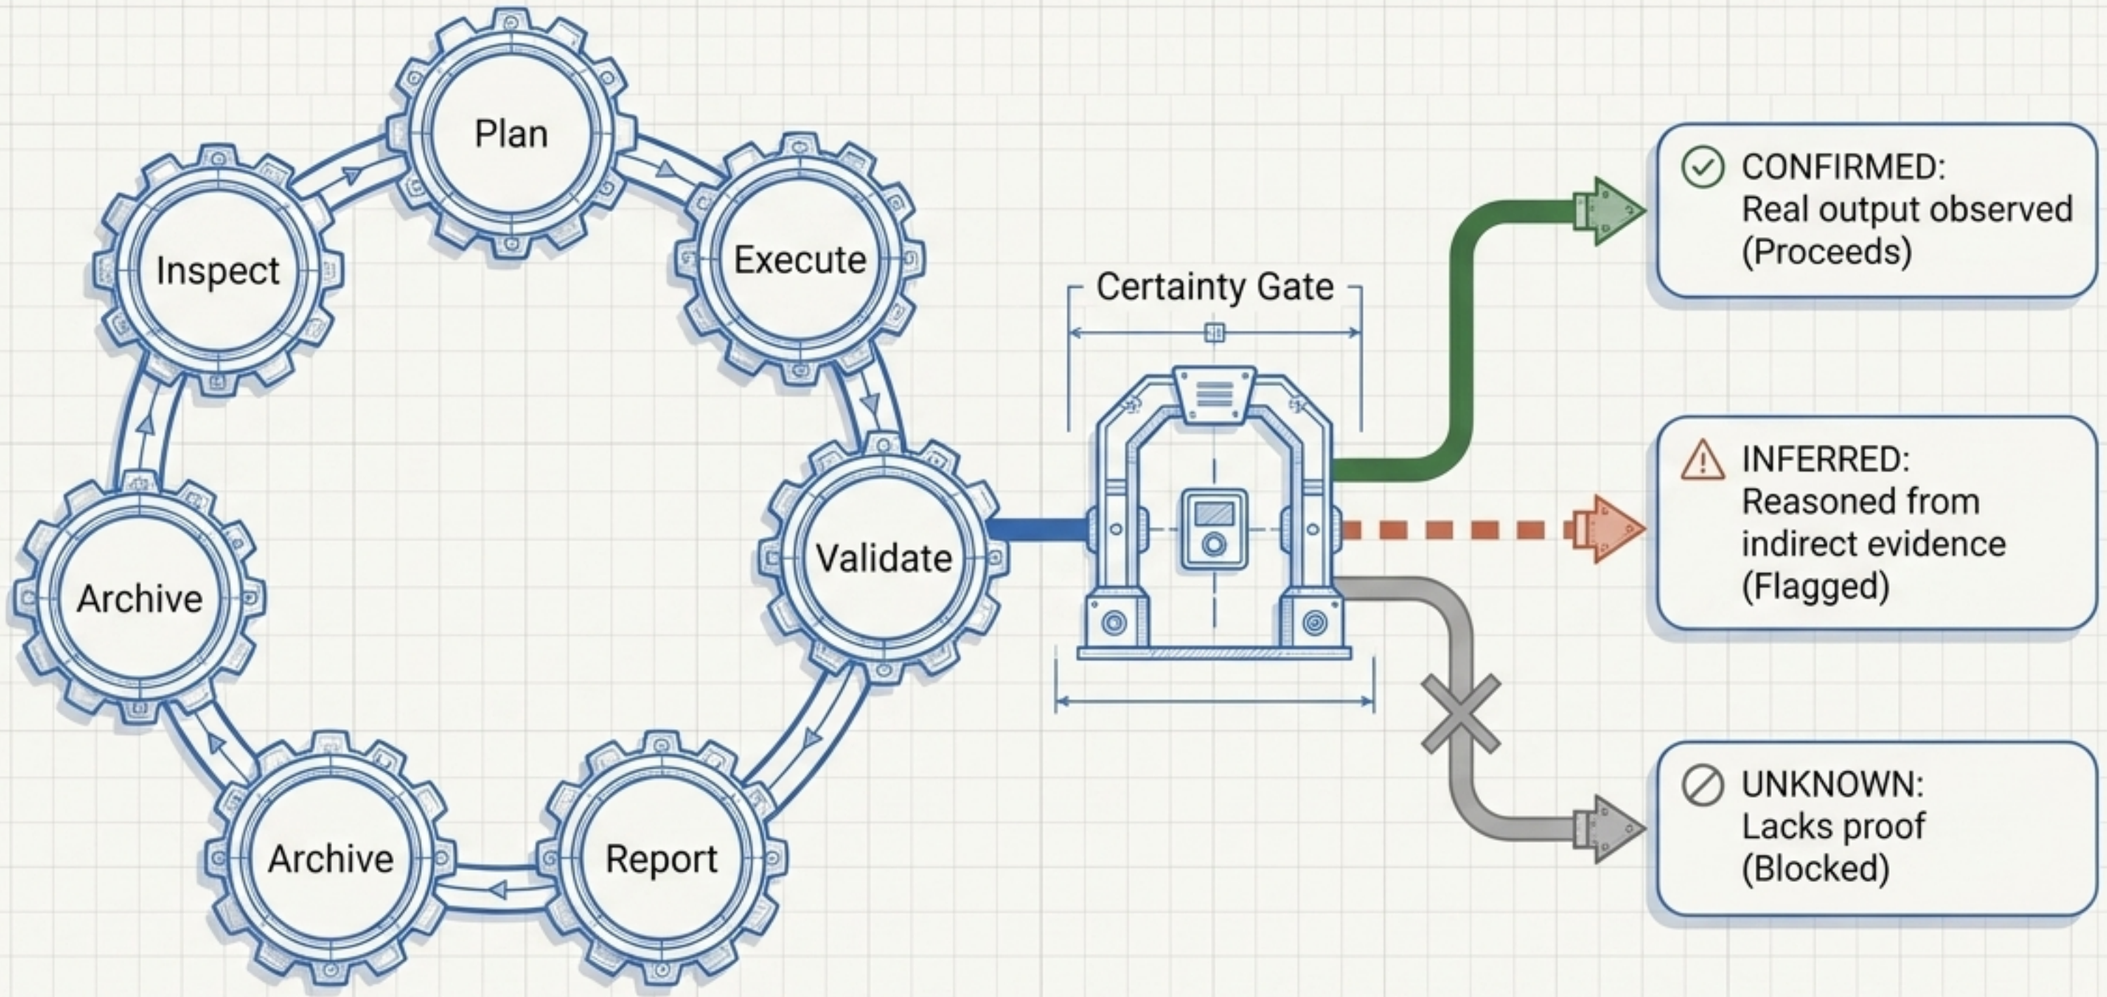

- Raw secrets are quarantined, never rendered or stored raw.
- Every agent action must attach an immutable Evidence Card.

NotebookLM

The Agent Operating Contract

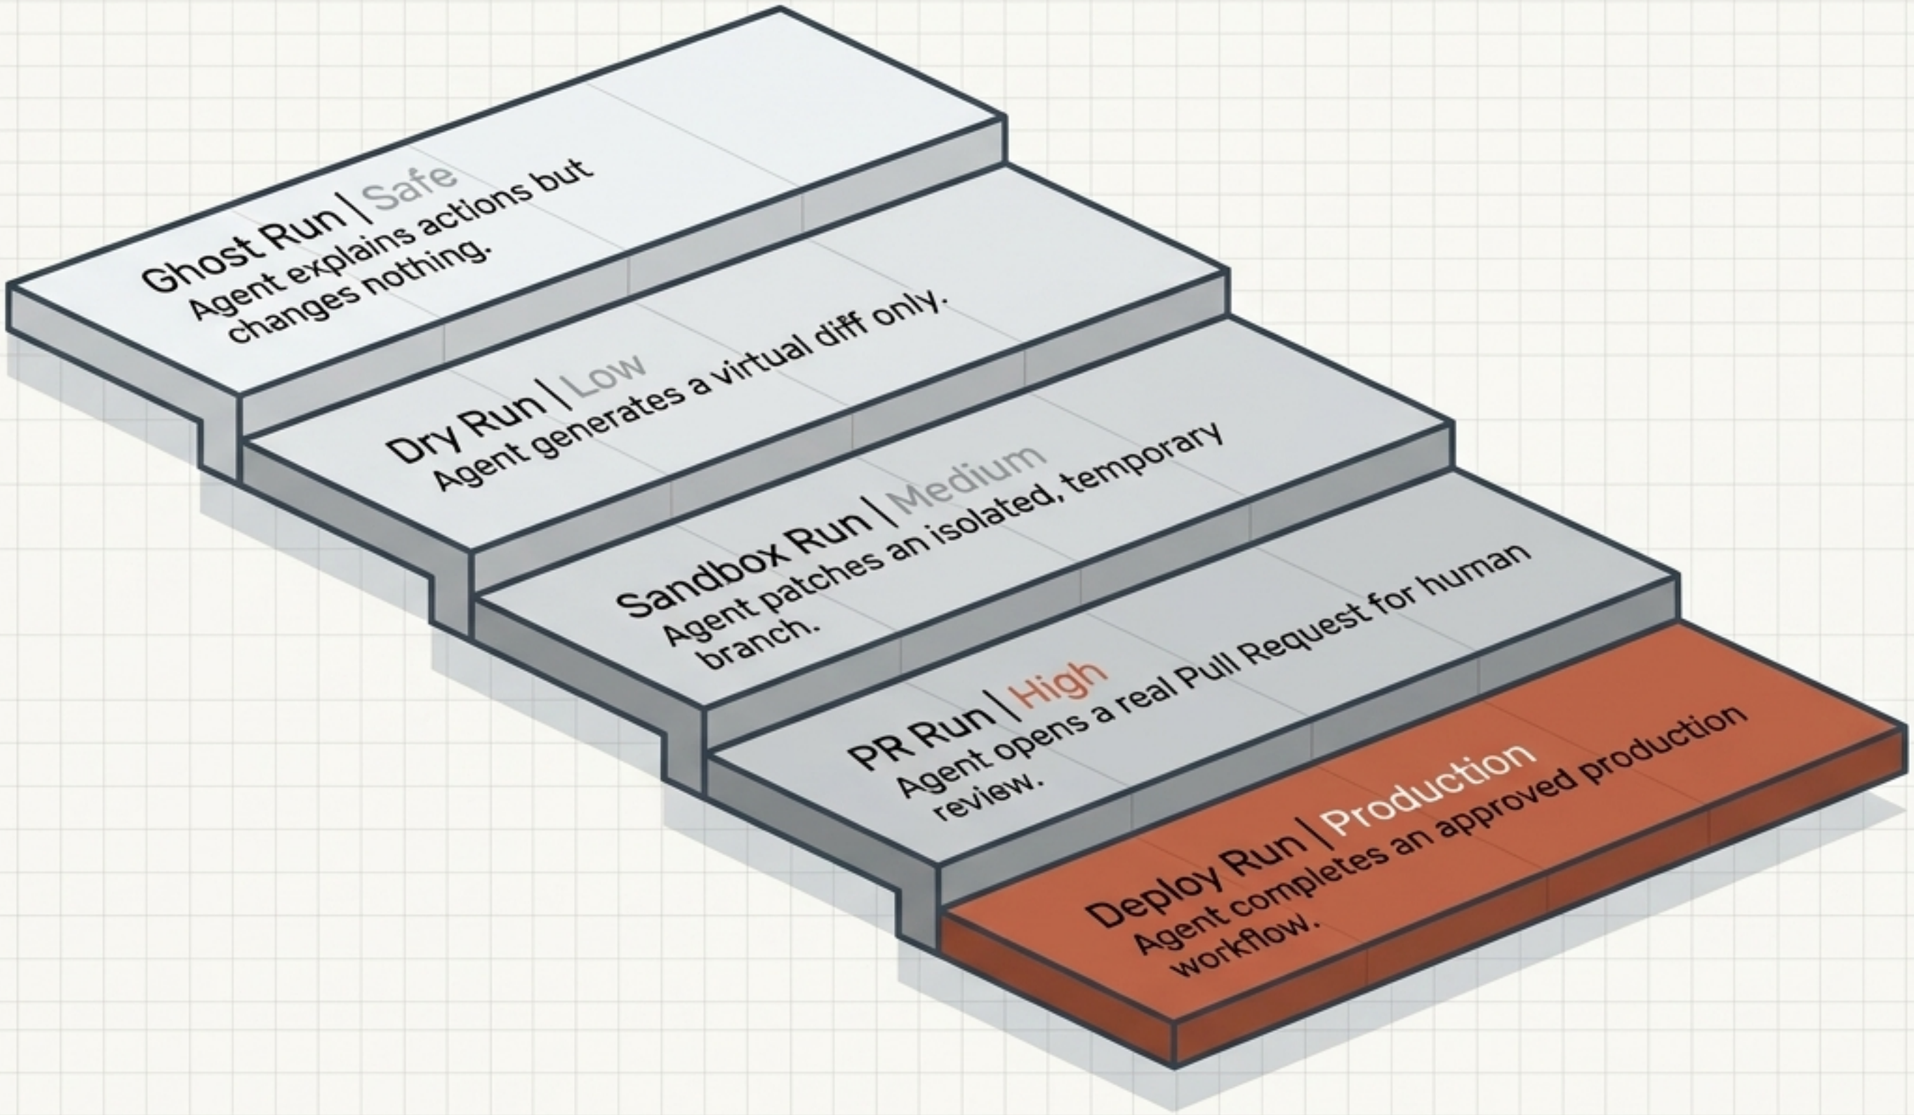

NotebookLM

The Autonomous Workforce Matrix

Role	Core Mission	Model Class	Permission Tier
Mise Garde	PR hygiene & code review	Coding Model	PR-Only
Sentinel	Security, secrets, risk	Classifier	Read-Only / Alert
Forge	Package releases	Tool-Use System	Safe Write (Gated)
Maestro	Workflow orchestration	Reasoning System	Execution Router

NotebookLM

The Simulation Lab: Execution Risk Tiers

NotebookLM

Use Case: From Alert to Autonomous Resolution

Scenario: A repository breaks after a dependency update.

Building flickers in Repo City.

Mise Garde agent reads logs & past failures

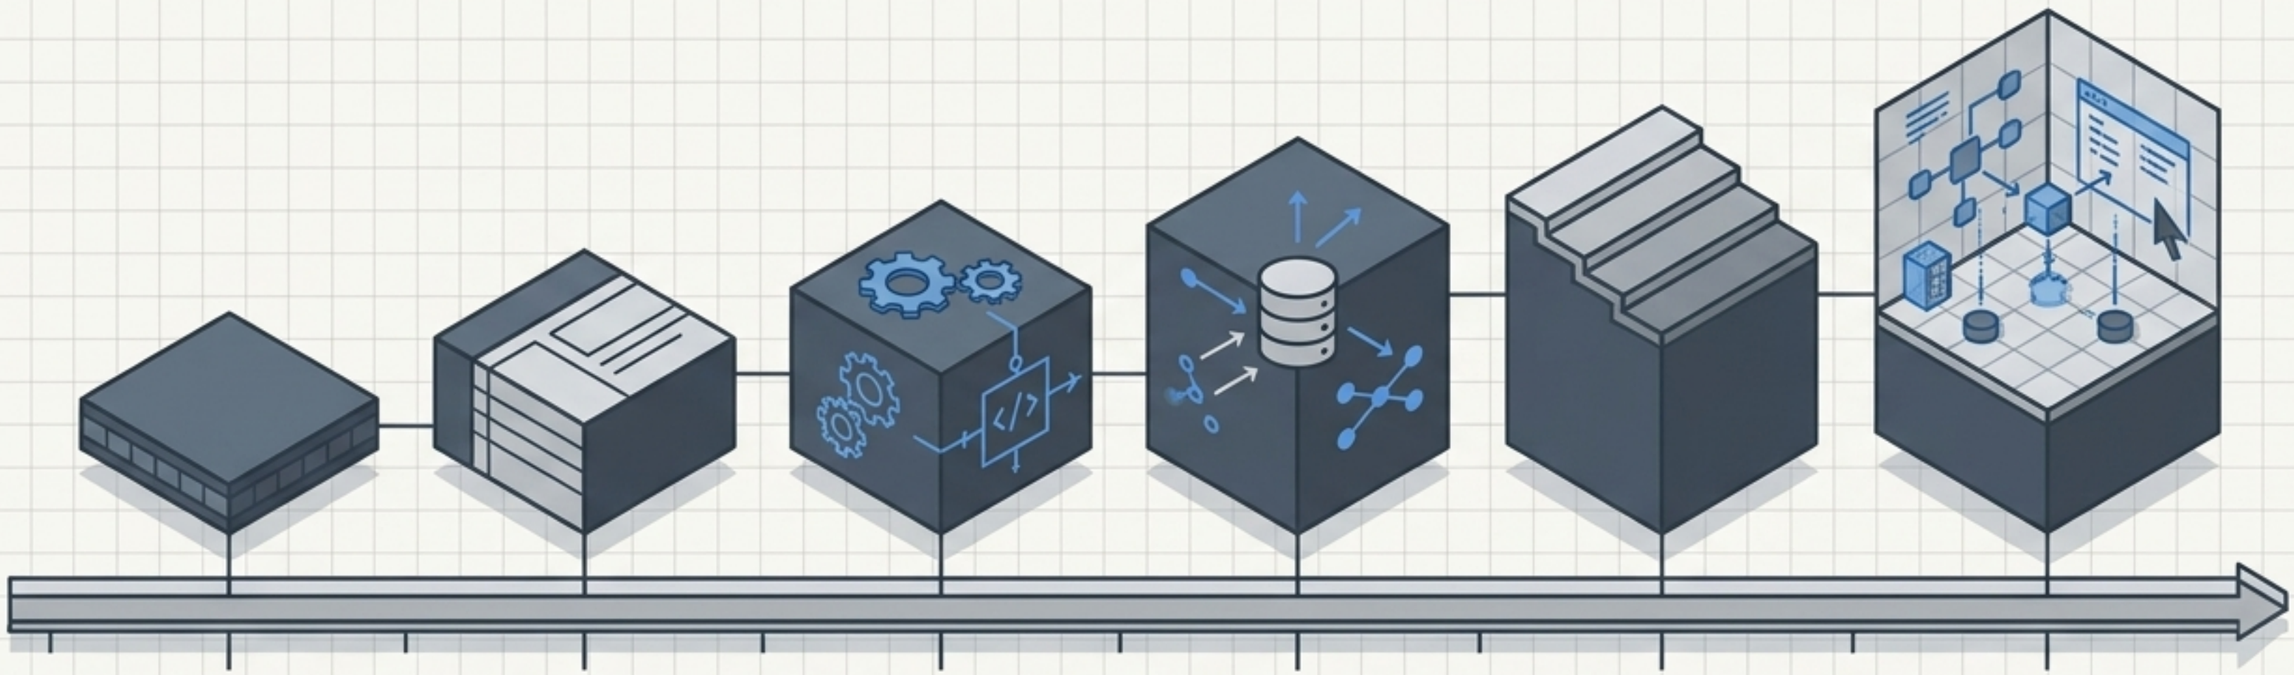

Sandbox fix simulated & passed for approval

Evidence recorded, PR merged, status healthy

NotebookLM

The Path to Market: Build Plan

Phase 1: Spreadsheet DB Prototype	Phase 2: Web Grid UI	Phase 3: Automation Engine	Phase 4: RAG Memory Layer	Phase 5: Simulation Lab	Phase 6: Full Metaverse World
Baserow / Grist	Next.js	GitHub App Integration	pgvector embeddings	Risk execution tiers	Spatial interactive UI

NotebookLM

Monetization & The Final Vision

A personal metaverse where every repository becomes a living system, every agent has a role, every action has evidence, and every autonomous capability can be simulated.
