MISEOS

CANON BIBLE v1.0

Authoritative character, world, visual, metadata and publishing standard

Status: Foundation Canon | Version: 1.0.0 | Scope: MiseOS / GridOps / Chef Brigade 300 / Mise Orchestra / Registry

Canon Declaration

This Bible is the governing reference for MiseOS identity, visual continuity, character usage, product artifacts, GridOps world design, metadata, repositories and publishing. Machine-readable files shipped with this document are normative. The document explains the rules; the registries enforce them.

Layer	Canonical identity	Primary use
MiseOS	Operating system and governance layer	Brand, orchestration, policy and evidence
GridOps	Living operational command world	Spatial interface, graph, timeline and digital twin
Generation One	Founders and product guides	UI, onboarding, documentation and navigation
Chef Brigade 300	Operational workforce	Executable agent identities and organizational taxonomy
Mise Orchestra	Story and collectible universe	Comics, games, animation and eligible blockchain assets
Registry	Product packages and capabilities	SDKs, schemas, workflows, marketplace and distribution
Chronicles	Serialized story system	Social, web archive and transmedia narrative

Canon authority order

- Approved machine-readable entity record
- Approved asset-registry entry and checksum
- This Canon Bible
- Repository documentation
- Marketing copy and social posts
- Conversation history and drafts

When two sources disagree, the higher source in this order governs. Conversation history is never the final source of truth.

1. Canonical Artwork System

Artwork is divided into three distinct systems. They may collaborate, but they must not be collapsed into one visual category.

System	Visual signature	Canonical use	Forbidden use
Generation One	Clean background, simplified character, readable silhouette	Product guide, tool face, small avatar, onboarding, docs, UI	NFT rarity card unless separately approved
Mise Orchestra Generation Two	Premium black-and-gold cinematic card, technical telemetry, differentiated aura	Chronicles, games, animation, dossiers, collectibles and approved NFTs	Generic product package or registry manifest
Registry artifacts	Product capability card or badge; package-centered identity	Docs, marketplace, SDK/package screens, release announcements	Counted as a character agent or mascot workforce member

Generation One: simplified product-guide language.

Mise Orchestra Generation Two: premium narrative and collectible language.

Registry: product capability artifact, not a character-agent record.

Artwork evidence statuses

Status	Meaning
canonical	Explicit source file, entity ID and metadata match; approved for production
canonical-candidate	Strong title/catalog match; awaiting owner approval
provisional	Alias or role-based match; usable only in internal development
unassigned	Artwork exists but no entity match is approved
deprecated	Retained for provenance; prohibited for new production

The accompanying asset registry currently contains 224 page-level and file-level evidence records. The official individual trading-card pack supplies the strongest evidence for its 23 characters.

2. Generation One to Mise Orchestra Mapping

Generation One and Generation Two are related manifestations, not automatically the same character. A mapping requires shared entity identity, role compatibility, visual approval and provenance. Generation One can represent the product-facing interface while the Generation Two form represents the same capability in story, game or collectible contexts.

Mapping type	Rule	Example use
Direct manifestation	Same canonical entity and role across both styles	UI guide opens a Chronicle dossier of the same agent
Tool-face association	Generation One guide represents a registry product, not a workforce agent	Clean guide becomes the face of Agent SDK onboarding
Role archetype	Early artwork expresses a role but has no approved identity	Hold as unassigned until reviewed
No mapping	Visual or role conflicts with current canon	Archive or reassign through canon review

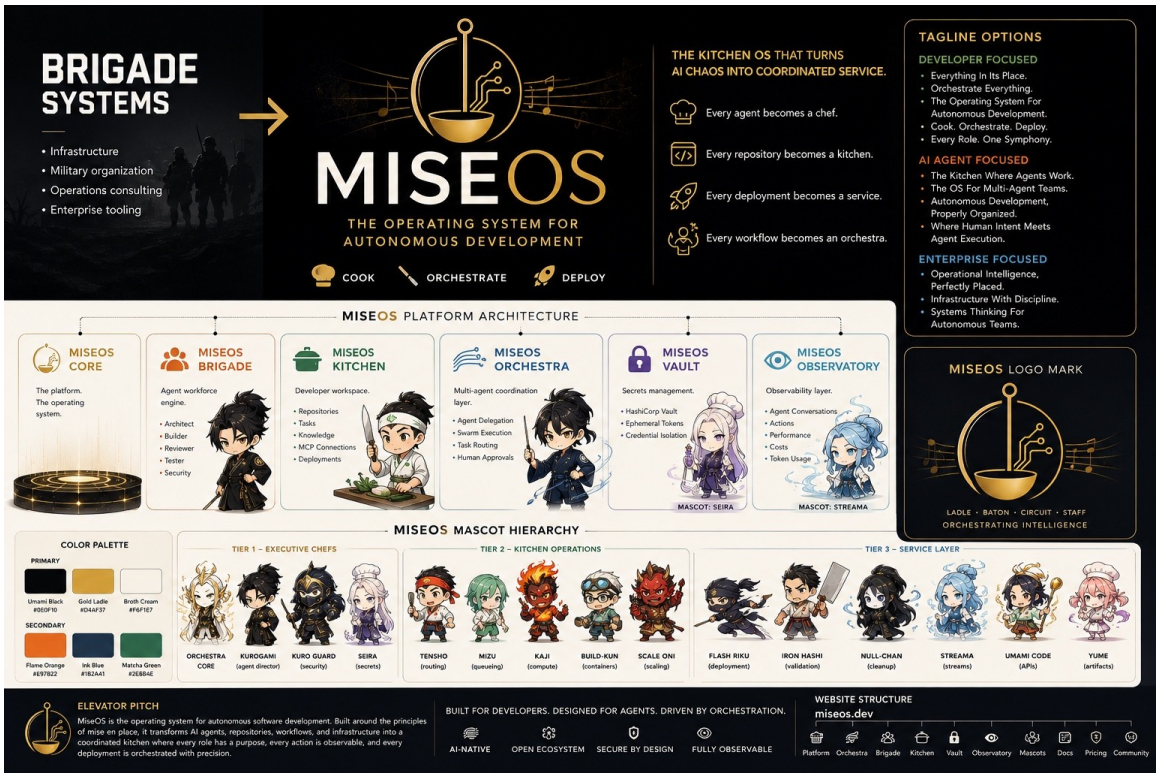

Mapping approval checklist

- One canonical entity ID
- Compatible department and operational role
- Approved name and pronouns
- Source asset and SHA-256 checksum
- Generation-specific use rights
- Model-sheet review
- No collision with another canonical character

The shipped generation-crosswalk.csv covers all current 112 canonical roster records. It intentionally leaves Generation One assignments unapproved rather than guessing.

3. GridOps District Atlas

GridOps is a reconfigurable spatial and graph-native interface. The world is a functional operational model: architecture, routes, barriers, signals and environmental changes must correspond to real system states.

Existing platform architecture reference used as a structural—not literal—world guide.

ID	District	Purpose	Accent
GRID-001	Singularity Core	Central obsidian-brain operating core	#D4AF37
GRID-010	GridOps Command Center	Mission control, routing and state overview	#D4AF37
GRID-020	Pipeline Kitchen	Repository intake through verified release	#E97822
GRID-030	Platform Kitchen	Golden paths and stable service foundations	#1B2A41
GRID-040	Reliability Kitchen	Observe, measure and improve	#2E6B4E
GRID-050	Security Kitchen	Guard, audit and comply	#8B1E2D

GRID-060	Data & Insight Kitchen	Learn, optimize and evolve	#17A2A4
GRID-070	Operations Kitchen	Coordinate service execution	#D4AF37
GRID-080	Registry Citadel	Packages and capability marketplace	#C8A951
GRID-090	Memory Vault	Governed memory and lineage	#7C3AED
GRID-100	Human Approval Chamber	Protected decisions and explicit consent	#F8F4E3
GRID-110	Release Horizon	Final verified publication boundary	#F97316

Spatial grammar

- Repositories are structures or districts, not decorative scenery.
- Workflows are traversable routes with visible state and ownership.
- Agent handoffs are moving packets with source, target and evidence.
- Policy gates are visible barriers with explainable denial or approval states.
- Incidents are distortions localized in service, dependency and time.
- Memory is navigable lineage; unproven memory is visibly marked.
- Release Horizon is inaccessible until required evidence and approvals are complete.

4. Singularity Core Design Specification

The Singularity Core is the visual and functional center of GridOps: an obsidian brain, superconducting circuit machine and liquid-glass interface that can shift between dashboard, graph, world, timeline and virtual-reality modes.

Layer	Visual behavior	System meaning
Obsidian shell	Dark faceted protective body	Governance boundary and system integrity
Liquid-glass lattice	Transparent refractive interior	Visible state, explainability and reconfiguration
Gold circuits	Stable persistent routes	Governance, verified actions and official state
Cyan streams	Fast moving data flow	Telemetry, context and intelligence
Violet field	Deep layered memory volumes	Knowledge graph, vector memory and lineage
Emerald pulses	Healthy rhythmic signals	Reliability and successful verification
Orange routes	Task and deployment movement	Pipelines, execution and release
Crimson fractures	Localized warnings or locks	Security incident, policy violation or blocked action

Interaction modes

- 1D Status: compact state and alerts
- 2D Operations: dashboards, diagrams and evidence panels
- 3D World: districts, agents, routes and incidents
- 4D Timeline: history, causality, lineage and counterfactual playback
- VR Interface: embodied navigation with identical authority and evidence rules

The Core may look mystical, but every effect must communicate an operational meaning. Random magic is not canon.

5. Character Production Rules

Rule	Requirement
Silhouette	Readable at avatar size and recognizable without card text

Tool language	Primary prop directly represents the agent function
Department aura	Use department accent and operational symbolism
Expression set	Neutral, focused, success, warning, failure, collaboration
Model sheet	Front, side, back, three-quarter and scale reference
Continuity	Hair, eyes, clothing, emblem and equipment remain stable
Telemetry	Labels must reflect actual capabilities or clearly marked concepts
Power system	Every augmented ability is a visualization of an operational function
Collaboration	Important missions require handoffs and evidence, not lone-hero solutions
Claims	Never imply an unimplemented capability is deployed

Required character package

- entity.json
- character-bible.md
- model-sheet.png
- avatar.png
- card.png
- expressions.png
- palette.json
- rights.json
- provenance.json
- runtime-contract reference
- comic reference
- optional animation/GLB/audio/AR assets

6. Visual Design System

Existing MiseOS brand-system reference.

Token	Meaning	Suggested value
Obsidian	Primary world background	#07090D
Midnight navy	Panels and architectural depth	#12263A
Mise gold	Governance, verified state, official release	#D4AF37
Electric cyan	Data and intelligence	#22D3EE
Emerald	Reliability and healthy systems	#16A34A
Crimson	Security, denial and incident	#DC2626
Pipeline orange	Build, workflow and deployment	#F97316
Memory violet	Knowledge, lineage and orchestration	#7C3AED
Ivory glass	Readable foreground and approval surfaces	#F8F4E3

Typography and composition

- Editorial headline: large, short and spacious.
- Technical secondary text: compact monospaced labels.
- Maximum two speech bubbles per comic panel.
- Use wide negative space in signals and announcements.
- Keep grid-safe content inside a central 1:1 crop even when exporting 4:5.
- Cards may be ornate; product briefs must remain clear and restrained.

7. Comic Production Guide

Every Chronicle must entertain, teach and reveal a real or planned MiseOS capability.

Beat	Purpose
1. Operational problem	A recognizable repository, workflow, policy, reliability or customer problem
2. Character activation	Correct specialist enters because the role matches
3. Augmented power	Operational function becomes visible
4. Collaboration	Handoff to synchronized agents with evidence
5. Capability reveal	Connect the story to a product surface or release state

Comic canon rules

- Technical concepts must survive expert review.
- No important action completes without the required evidence gate.
- A registry product can empower a character but is not itself a character.
- Character victories must preserve permission boundaries.
- Failures and uncertainty are visible, not hidden by confidence.
- Final panel records content ID, canon level and capability status.

Production record

Each episode requires content ID, season, episode, featured entity IDs, products, technical concepts, claim level, source assets, rights, accessibility text, analytics events and export variants.

8. Complete Metadata Schema

The normative JSON Schema is included as schemas/canon-entity-v1.schema.json. All surfaces should reference canonical entity IDs rather than copying names as identity.

Namespace	Purpose
identity	Name, slug, IDs, department, role and generation
canon	Status, confidence, approval and deprecation
design	Palette, silhouette, model sheet, props, expressions and aura

workflow	Inputs, outputs, proof gates, synchronized agents and failure behavior
runtime	Tools, permissions, authority, retries, observability and deployment
media	Image, animation, model, audio and AR references
rights	Owner, license, commercial use, NFT eligibility and restrictions
provenance	Source, checksum, creator, generation method and lineage
analytics	Amplitude IDs, event taxonomy and measurement goals
publishing	Claim level, channels, formats, release and archive state
relationships	Character, package, district, workflow and story links

Status vocabulary

Concept -> Designed -> Specified -> Scaffolded -> Implemented -> Tested -> Integrated -> Deployed -> Public -> Deprecated

9. Asset Registry

The asset registry is the bridge between files and canon. A filename alone is not identity. Every production asset must resolve to an asset ID, source, checksum, entity ID, generation, use rights and approval status.

Required field	Reason
asset_id	Stable cross-surface reference
canonical_entity_id	Prevents name-based collisions
source_file/page	Traceable origin
checksum	Integrity and duplicate detection
match_method	Explains why the asset belongs to the entity
match_status	Controls production eligibility
approved_use	Prevents cross-surface misuse
NFT eligibility	Separates narrative ownership from token permissions
notes	Records exceptions and review decisions

Current evidence summary:

Status	Count
canonical	23
canonical-candidate	80
provisional	44
unassigned	77

10. Repository Organization and Publishing Pipeline

Publishing gates

Gate	Must be true
Asset match	Canonical IDs, asset IDs and provenance attached
Technical review	Concept and product claims match real readiness
Canon review	Character, world and relationships follow this Bible
Rights review	Use, commercial and NFT permissions are explicit
Approval	Copy, accessibility, analytics and exports complete
Measurement	Published content records performance and learnings
Archive	Final files and metadata remain reproducible

Automation requirements

- Validate JSON Schema on pull request.
- Reject duplicate entity and asset IDs.
- Verify referenced files and SHA-256 checksums.
- Block NFT metadata unless nft_eligible=true and rights are complete.
- Block public publishing when public_claim_level exceeds readiness status.
- Generate content manifests and web archives from canonical metadata.
- Preserve deprecation history instead of deleting old canon.

Appendix A - Canon Counts and Boundaries

Category	Current canon
Current canonical characters	112
Planned expansion characters	188 (agents 113-300)
Chef Brigade target	300 character agents
Registry manifests	23 product infrastructure records
Generation One source pages	76 early visual references
Mise Orchestra PDF card pages indexed	96 visible card records
Official individual trading-card pack	23 characters with PNG + ERC-721 metadata

The current expanded public model is 300 character agents + 23 registry manifests = 323 MiseOS ecosystem items. Readiness and approval status must remain explicit; a planned agent is not automatically implemented or publicly available.

Appendix B - Initial Verified and Candidate Artwork

Asset ID	Entity	Generation	Status	Source	Page
MISE-G2-P001	Flash Riku	Mise Orchestra Generation Two	canonical-candidate	1E3334AB-3111-4E81-AECF-71CB094259F8.pdf	1

The complete list is provided in registry/asset-registry.csv and .json. This appendix is intentionally abbreviated for readability.

Appendix C - Approval Record

Field	Value
Canon version	1.0.0
Document status	Foundation canon - requires owner sign-off for provisional mappings
Normative files	canon-entity schema, asset registry, generation crosswalk, district atlas, publishing pipeline
Next review	After Generation One mapping and Alko/Bruno/Lila/Evidence Scribe artwork approval
Change policy	Semantic versioning; every breaking canon change increments major version
